

“Absence of activity in the monitor gives assurance to the customer there is no immediate threat to the building.”

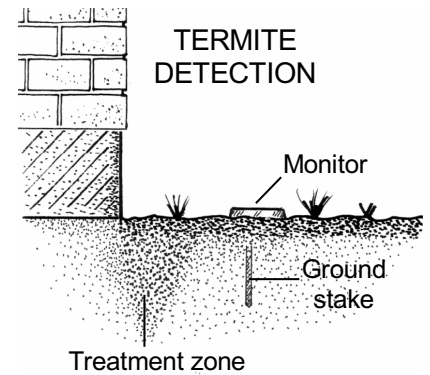

Bill Robinson

Termite monitors provide an 'early-warning' for the presence of termites close to the outside perimeter of the house, around an outbuilding, and in a crawl space. Absence of activity in the monitor gives assurance to the customer there is no immediate threat to the building. Monitors with a company logo provide an ongoing indication of service.

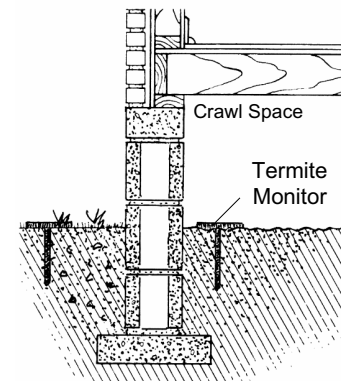

Monitors can be installed any time of the year, including winter—which may be the best time. The top 1-2 in. of soil may be frozen and hardened but below that, the soil is generally soft enough to take the stake. Subterranean termites remain active during winter and will feed in moist soil where the temperature is 40° F or more. Winter installation provides foraging termites time to locate and establish the monitor as a feeding site by spring. Termites are usually more active in the spring and fall, when soil moisture is high and temperatures are favorable.

Place 6-10 inches from foundation to intersect the termiticide treatment zone established by trenching and rodding. Sheltered and shaded locations provide extended periods of moist soil and protection from temperature extremes. In open areas, soil moisture is usually low, especially in summer when daytime temperatures are high. Dry and hot soil is not favorable foraging sites for subterranean termites.

Monitors should be inspected regularly, and replaced when lost or removed. New cellulose matrix should be inserted whenever it is damaged by mold, fungi, or consumed by slugs. The monitors in favorable locations: shaded sites with moist soil are likely to have activity year round. Monitors in open and sunny locations are likely to have activity in spring and fall.

Termite monitors placed in or near the treatment zone can give an indication of the efficacy of the treatment

Aggressive termite monitoring can give you advanced warning of the presence of termites without having to rely on swarm events

The TM-1 Termite Monitor imprinted with your valuable company name just **\$1.64*** each
